

Ten tips on how to use the web and technology safely

1

Update the software on your phone, computer, and all other devices connected to the Internet regularly.

2

Never install software from unknown sources, remember that no bank will ever force you to install their mobile app.

3

Don't use your password twice in different systems, best use a password manager and a 2FA.

4

Be careful on what links you click - both in emails/text messages, and while visiting websites.

5

When downloading files from the Internet, always check twice what extensions they have - avoid download managers and files which are apps.

6

Use an antivirus and firewall.

7

Make backup copies of sensitive data regularly and keep them in the cloud.

8

Be particularly careful when you provide your personal or payment details - don't do it on the phone or via email.

9

To protect your privacy, use a VPN, and encrypt your hard drives to protect your data.

10

Set passwords for all devices with which you travel: phone, computer, and tablet. Never leave them unlocked.
